

Build practice. Learn from the revision.

ASU learning design, original Coursera lessons
and Figma workflow design.

Instructional Designer (Temporary) application · September 2026

Make revision something the learner can see

I created a beginner project around drafting, reviewing and refining content against a goal.

Published teaching activity. Learner improvement is not measured here.

Task 3

Goals

Iteratively Transform Content Using AI

- Use ChatGPT to create an initial draft and make iterative refinements.
- Practice refining drafts using different prompt techniques and feedback loops.
- Analyze how each iteration impacts content quality and alignment with goals.

Original 2024 lesson material · goals excerpt

Make the review change the material

Review finding	My documented revision
Choices were easy to eliminate	Reworked distractors, especially Questions 7, 8 and 10.
Question 7 tested only a definition	Added application of the concept alongside the definition.
Retry feedback revealed answers	Made feedback more neutral and referred learners to the lesson task.
Task references were incorrect	Corrected references across the assessment.

Review added detail before accepting it

The lesson made an instruction visible beside the result it changed. That gave learners something concrete to inspect.

The revised answer added detail. In my retrospective, I would make factual checks and length limits more explicit.

Can you make this more engaging and inviting? Include sensory details and a friendly tone. Enhance it with substantance and a call to actions that includes essence what brings a coffee Enthusiasts their love for coffee.

Human review before learner-facing tasks

A staged prompt workflow for personalized learner tasks.

Simplified reconstruction · Documented proposal; no deployment or measured efficiency claimed.

Recovery follows the failure

An incomplete answer and a lost connection need different next actions.

I assembled the flows and their next actions into an annotated handoff for engineering.

Incomplete answer

Connection lost

Use research to find the learning need

At ASU, I developed learning materials and workshops and evaluated voice and chat flows. Product research adds practice clarifying the task before proposing support.

My next step would be to test a teaching approach with staff doing real work and measure what changes.

Learning design

Objectives, demonstrations and practice

Research

Questions about context and friction

Workflow design

Actions and recovery explained to engineering

Evaluation to propose

Completion, correction and repeat use

Connect the action to the decision

Choose one learner task

Work with an expert to choose a useful task.
Define what the learner needs to recognize
and which result they should inspect.

Review accuracy and usability

Check the content with domain experts.
Watch a learner try the task and note
where the explanation leaves them uncertain.

Build a focused learning path

Outline the goal, prerequisites and practice.
Use a short demonstration and a safe example
that the product team has verified.

Publish through the team workflow

Learn the authoring tools and review process.
Document content and version dependencies
and revisit content when behavior changes.

Let's make technical work easier to learn

Mesa, Arizona. Applying for the listed 100% remote U.S. arrangement.
