

Teach the workflow. Make judgment part of it.

Practical AI teaching, prompt checks
and research-informed workflow design.

AI Enablement Lead application · September 2026

Make revision something the learner can see

I created a beginner project around drafting, reviewing and refining content against a goal.

Published teaching activity. Learner improvement is not measured here.

Task 3

Goals

Iteratively Transform Content Using AI

- Use ChatGPT to create an initial draft and make iterative refinements.
- Practice refining drafts using different prompt techniques and feedback loops.
- Analyze how each iteration impacts content quality and alignment with goals.

Original 2024 lesson material · goals excerpt

Make the review change the material

Review finding	My documented revision
Choices were easy to eliminate	Reworked distractors, especially Questions 7, 8 and 10.
Question 7 tested only a definition	Added application of the concept alongside the definition.
Retry feedback revealed answers	Made feedback more neutral and referred learners to the lesson task.
Task references were incorrect	Corrected references across the assessment.

Review added detail before accepting it

The lesson made an instruction visible beside the result it changed. That gave learners something concrete to inspect.

The revised answer added detail. In my retrospective, I would make factual checks and length limits more explicit.

Can you make this more engaging and inviting? Include sensory details and a friendly tone. Enhance it with substantance and a call to actions that includes essence what brings a coffee Enthusiasts their love for coffee.

A cleaner rewrite can lose the task

ORIGINAL PROMPT

Return valid JSON only with fields category, article_id, confidence, and suggested_response. If confidence is below 0.7, set suggested_response to needs_review. Success: parser accepts the response.

The original explicitly keeps:

JSON-only output · four named fields
confidence below 0.7 → needs_review
parser acceptance as the success test

SHORTER REWRITE

Return a clean structured answer with the best response for the user.

The rewrite removes:

The named fields, the JSON-only requirement, the low-confidence fallback and the parser success test.

Recovery follows the failure

An incomplete answer and a lost connection need different next actions.

I assembled the flows and their next actions into an annotated handoff for engineering.

Incomplete answer

Connection lost

Give the tool a clear role

The local tool returns structured checks and routing.
The host assistant handles the conversation and final wording.

Use research to find the learning need

At ASU, I developed learning materials and workshops and evaluated voice and chat flows. Product research adds practice clarifying the task before proposing support.

My next step would be to test a teaching approach with staff doing real work and measure what changes.

Learning design

Objectives, demonstrations and practice

Research

Questions about context and friction

Workflow design

Actions and recovery explained to engineering

Evaluation to propose

Completion, correction and repeat use

Start with a task staff already need to do

Understand one workflow

Ask about the task, data and current effort.
Agree on a safe practice example and what a useful result must preserve.

Support the next attempt

Use office hours to inspect stuck points.
Turn recurring questions into brief guidance and improve the practice material.

Teach through practice

Demonstrate the workflow, then let staff try.
Make source checks, output review and escalation part of the exercise.

Check what changed

Compare completion and correction effort.
Ask whether people use the workflow again.
Keep self-reports separate from observed use.

Let's make AI use easier to learn and evaluate

Mesa, Arizona. Full U.S. work authorization. Available to start as soon as possible.
