

Jonathan Kyle Hobson

UX Designer • Application to Trase Systems

Mesa, Arizona | JonathanKyleHobson@gmail.com

September 8, 2026

Dear Trase team,

An AI product has to explain itself before, during, and after an answer. That is the work I would bring to Trase: designing a useful starting point, making the system's state understandable, and giving people a clear next action when something goes wrong. Your UX Designer role connects those product decisions with demos and presentations, which is a strong match for my work in UX and technical communication.

At FactorLab, I design web and mobile experiences for SmartTagIt. For its Flint AI assistant, I developed question-entry, waiting, saved-question, and recovery flows, then organized the states and annotations for engineering. A partial answer and a lost connection needed different messages and actions. The accompanying portfolio shows those decisions and the handoff, with the stage of the work stated alongside the screens.

The About Me work addresses another part of AI adoption: helping people interpret an insight. I explored how summaries connect to supporting observations, comparisons, and a useful next step. At Oak AI, I connected usability evaluation with concrete navigation and error-feedback recommendations. Across these projects, I make the reasoning visible enough for a team to examine and act on.

My instructional design, conversational AI, and documentary storytelling background also informs how I explain a product to a new audience. I have prepared a separate portfolio and visual presentation for this role, emphasizing AI interactions, reusable interface patterns, and clear product narratives. I would welcome a conversation about applying that approach to Trase's product and demo experiences.

I am based in Mesa, Arizona, am authorized to work in the United States without sponsorship, and can start as soon as possible.

Thank you,
Kyle Hobson
