

AI ideas made inspectable

Local AI tools, client-facing research
and practical technical teaching.

Partner AI Deployment Engineer application · September 2026

Prompt Compass workflow

The local tool returns structured checks and routing.
The host assistant handles the conversation and final wording.

Assessment review and revision

Review finding	My documented revision
Choices were easy to eliminate	Reworked distractors, especially Questions 7, 8 and 10.
Question 7 tested only a definition	Added application of the concept alongside the definition.
Retry feedback revealed answers	Made feedback more neutral and referred learners to the lesson task.
Task references were incorrect	Corrected references across the assessment.

Paraphrased original review and instructor-response notes · revisions, not final QA signoff

Requirements lost in a rewrite

ORIGINAL PROMPT

Return valid JSON only with fields category, article_id, confidence, and suggested_response. If confidence is below 0.7, set suggested_response to needs_review. Success: parser accepts the response.

The original explicitly keeps:

JSON-only output · four named fields
confidence below 0.7 → needs_review
parser acceptance as the success test

SHORTER REWRITE

Return a clean structured answer with the best response for the user.

The rewrite removes:

The named fields, the JSON-only requirement, the low-confidence fallback and the parser success test.

Recovery from interrupted answers

An incomplete answer and a lost connection need different next actions.

I assembled the flows and their next actions into an annotated handoff for engineering.

Incomplete answer

Connection lost

AI revision as guided practice

I created a beginner project around drafting, reviewing and refining content against a goal.

Published teaching activity. Learner improvement is not measured here.

Task 3

Goals

Iteratively Transform Content Using AI

- Use ChatGPT to create an initial draft and make iterative refinements.
- Practice refining drafts using different prompt techniques and feedback loops.
- Analyze how each iteration impacts content quality and alignment with goals.

Original 2024 lesson material · goals excerpt

Original lesson revision sequence

The lesson made an instruction visible beside the result it changed. That gave learners something concrete to inspect.

The revised answer added detail. In my retrospective, I would make factual checks and length limits more explicit.

Can you make this more engaging and inviting? Include sensory details and a friendly tone. Enhance it with substantance and a call to actions that includes essence what brings a coffee Enthusiasts their love for coffee.

Discovery, demonstration and handoff

My work connects a question from a person or team to a concrete artifact: a tool, interaction decision or learning example that others can examine.

For Eliza, I would use that combination to clarify a client task and make the demonstration useful to both business and technical collaborators.

Prompt Compass · 2026

Explicit requirements and local checks

Start with a task the client recognizes

Understand the client's task

Trace the current task with its owner.
Name the input, output and decision.
Check which constraints the example must keep.

Turn observation into practice

Let participants try a changed input.
Ask how they would judge the result.
Record confusion, missing context and errors.

Build a bounded demonstration

Choose one useful slice with the delivery team.
Show what works and where it fails.
Keep assumptions visible during discussion.

Prepare the next handoff

Document setup, limits and review needs.
Keep the example and practice material together.
Confirm what needs engineering work next.

Let's make the next idea testable

Mesa, Arizona. Full U.S. work authorization. Available to start as soon as possible.
