

Useful AI needs clear interaction

FactorLab interaction design, Oak research
and local AI tools.

Sr Product Designer application - September 2026

Editable starting questions

Suggested questions offered a starting point while leaving the person free to edit or ask something else.

I worked within the existing product, keeping the answer layout and agreed phase scope in view.

The requirements still need to hold

I built a tool for inspecting prompt requirements and comparing versions. A shorter instruction can lose an important review step.

Public beta release, April 2026. The example here shows a request clarified before a feature proposal.

Q: ****Stage 1 — Who is this feature spec for?****

This prompt is asking for a Prompt Compass MCP upgrade. Who needs to read and act on the output?

A: Codex — the developer who will implement the upgrade

Codex is the primary reader — implementation-focused, technical depth, actionable spec.

Improve prompt >

Original example session · feature proposal

Different failures need different actions

An incomplete answer and a lost connection need different next actions.

I assembled the flows and their next actions into an annotated handoff for engineering.

Incomplete answer

Connection lost

A shorter prompt can drop a review step

I compare prompt versions against explicit requirements instead of treating cleaner wording as automatically better.

This local example checks whether the revision still asks for review before implementation. It does not measure model accuracy.

ORIGINAL PROMPT

Return valid JSON only with fields category, article_id, confidence, and suggested_response. If confidence is below 0.7, set suggested_response to needs_review. Success: parser accepts the response.

The original explicitly keeps:

JSON-only output · four named fields
confidence below 0.7 → needs_review
parser acceptance as the success test

SHORTER REWRITE

Return a clean structured answer with the best response for the user.

The rewrite removes:

The named fields, the JSON-only requirement, the low-confidence fallback and the parser success test.

Original local evaluation example - requirement comparison

Route the work before generating the answer

A useful AI workflow needs a named task, a review point and a clear handoff to the person making the decision.

I use that structure in Prompt Compass and in my own AI-assisted design work. Generated output remains subject to review.

Original workflow example - task, output and review

Error feedback beside the field

I made the problem field visible where a person could act on it.

The recommendation gave the team a specific behavior to discuss and prioritize.

Original

The original login form is titled "Ready, Set..." with the subtitle "Log in to access your account". It features two input fields: "Email Address" and "Password". Below the fields are two buttons: "Log In" and "Send Me A One-Time Login Link". The form is set against a light blue background.

Original error at the page footer

Error: Invalid login credentials

Proposed

The proposed login form is identical to the original, but with a red border around the "Password" field. A green feedback message "Incorrect Password" is displayed to the right of the password field. The form is set against a light blue background.

Proposed feedback beside the field

Consistent color roles

Brand, backgrounds, text and feedback needed consistent roles across the interface.

I documented those roles for the next design iteration. This focused guide did not establish a complete component library.

Define the task before the interface

The analyst's immediate task

Observe one recurring readiness task.
Find what a person needs to review, edit
or compare before taking the next action.

A focused interactive prototype

Explore a small flow with AI-assisted tools.
Check generated behavior against the design
and involve engineering in implementation.

The interaction contract

Map inputs, agent responses and failures.
Agree with engineers on permissions,
follow-on actions and recoverable states.

Evidence for the next decision

Watch people use the proposed flow.
Revise unclear feedback and document
what is agreed and what still needs testing.

AI product design people can work with

Mesa, Arizona. Full U.S. work authorization. Available to start as soon as possible.
