September 8, 2026

Dear Timely product team,

I'm applying for Timely's Product Designer role. Your Mahwah case study describes making the effects of staffing choices visible before committing to a schedule. I'm interested in making those decisions easier to understand and test. My work combines operational product design at FactorLab, research at Oak and learning and AI experience at ASU.

At Oak, I connected a desktop usability evaluation to navigation alternatives and field-level login feedback, working with the lead UX designer. The goal was to make each recommendation concrete enough to discuss and act on. At FactorLab, I bring the same approach to Figma prototypes, reusable interface patterns and engineering annotations for SmartTagIt.

For its Flint assistant, a stopped answer and a lost connection leave different information available. I worked through the messages, recovery actions and return paths for both. In About Me, I explored how feedback summaries connect to their supporting evidence, including comparison language that avoids unsupported performance judgments.

My ASU work included digital learning materials and conversational AI flows. I proposed a staged prompt workflow with mentor review before personalized guidance reached learners. At Oppia, a recent learning-product review meant clarifying autosave behavior with engineering before finalizing the dialog guidance.

School master scheduling would be a new domain for me. I would start by observing a scheduler work through one difficult decision, map the constraints with your team and prototype a focused improvement before expanding it. That is a proposed starting approach; the portfolio shows my original design and research work. I'm based in Mesa, available for U.S. remote work as soon as possible and authorized to work without sponsorship.

Thank you,
Kyle Hobson
