

Jonathan Kyle Hobson

UX Designer • Application to Gather AI

Mesa, Arizona | JonathanKyleHobson@gmail.com

September 8, 2026

Dear Gather AI team,

Gather AI's combination of operator apps and AI-generated inventory insights makes this role especially relevant to my work at FactorLab. I design web and mobile interactions for SmartTagIt, where safety conversations and operational observations need to become information people can interpret and act on. I would bring that attention to meaning and task continuity into learning how your warehouse users work.

For SmartTagIt's About Me experience, I developed information architecture and reusable insight widgets that connect a summary to supporting observations and next actions. I compared content densities and raised questions about reference groups and interpretation. A dashboard needs to help someone understand what a difference means before asking them to act on it; those are the questions I bring into the design review.

For the Flint AI assistant, I defined entry, waiting, saved-question, and recovery states, then organized the flows and annotations for engineering. An interrupted answer and a lost connection needed different messages and actions. At Oak AI, I connected expert evaluation and usability work with navigation and error-feedback recommendations, collaborating with the lead designer on refinements.

I also build working AI tools. I released Prompt Compass as a public beta and later developed local evaluation examples to check whether prompt rewrites preserve required behavior. That work complements my Figma prototypes with implementation and testing experience. For Gather AI, I would start by observing the tasks and interruptions on site, then use focused prototypes to test the next interaction with the people doing the work.

I am based in Mesa, Arizona, am authorized to work in the United States without sponsorship, and can start as soon as possible. I am open to the customer-site and Pittsburgh travel described in the role. The accompanying portfolio and presentation show the relevant work and its stage of development.

Thank you,
Kyle Hobson
