

AI workflows people can use

Released MCP tooling, recovery design
and original AI teaching.

AI Enablement Engineer application · September 2026

Prompt Compass workflow

The local tool returns structured checks and routing.
The host assistant handles the conversation and final wording.

Assessment review and revision

Review finding	My documented revision
Choices were easy to eliminate	Reworked distractors, especially Questions 7, 8 and 10.
Question 7 tested only a definition	Added application of the concept alongside the definition.
Retry feedback revealed answers	Made feedback more neutral and referred learners to the lesson task.
Task references were incorrect	Corrected references across the assessment.

Requirements lost in a rewrite

ORIGINAL PROMPT

Return valid JSON only with fields category, article_id, confidence, and suggested_response. If confidence is below 0.7, set suggested_response to needs_review. Success: parser accepts the response.

The original explicitly keeps:

JSON-only output · four named fields
confidence below 0.7 → needs_review
parser acceptance as the success test

SHORTER REWRITE

Return a clean structured answer with the best response for the user.

The rewrite removes:

The named fields, the JSON-only requirement, the low-confidence fallback and the parser success test.

Original test inputs, excerpted from the portfolio rendering · expected winner: original prompt

Recovery from interrupted answers

An incomplete answer and a lost connection need different next actions.

I assembled the flows and their next actions into an annotated handoff for engineering.

Incomplete answer

Connection lost

AI revision as guided practice

I created a beginner project around drafting, reviewing and refining content against a goal.

Published teaching activity. Learner improvement is not measured here.

Task 3

Goals

Iteratively Transform Content Using AI

- Use ChatGPT to create an initial draft and make iterative refinements.
- Practice refining drafts using different prompt techniques and feedback loops.
- Analyze how each iteration impacts content quality and alignment with goals.

Original 2024 lesson material · goals excerpt

Original lesson revision sequence

The lesson made an instruction visible beside the result it changed. That gave learners something concrete to inspect.

The revised answer added detail. In my retrospective, I would make factual checks and length limits more explicit.

Can you make this more engaging and inviting? Include sensory details and a friendly tone. Enhance it with substantance and a call to actions that includes essence what brings a coffee Enthusiasts their love for coffee.

Support, research and implementation

I have worked on the technical system and on the explanation someone needs to use it. That includes ASU IT support, product research and an independently released AI tool.

For Coder, I would connect employee feedback to a small, inspectable change and test how another person uses it.

ASU IT support · 2020–2022

Campus updates and hybrid transitions

FactorLab Flint · 2026

Failure conditions and recovery actions

Coursera · 2024

Guided practice and assessment revision

Prompt Compass · 2026

Explicit requirements and local checks

A blocked task becomes a reusable path

Work through the blocked task

Watch the employee try the task.
Identify the expected output and the point where instructions or tooling stop helping.

Build a small reusable example

Make the required inputs and outputs clear.
Document setup, access and recovery.
Keep a failure example beside the working one.

Choose the right level of fix

Separate a one-time issue from a pattern.
Review examples with the Smart AI lead before changing a shared workflow.

Try it with another person

Ask someone to use it without the author.
Record where they need help or correction.
Use that evidence to revise the path.

Let's work through the blocked task

Mesa, Arizona. Full U.S. work authorization. Available to start as soon as possible.
