

Making an issue clear enough to act

Selected work in issue analysis,
technical collaboration and documentation.

Business Analyst, Data Operations · September 2026

Competing entry points

Training an assistant, starting a Vibecheck and requesting support competed at the same entry point.

I recorded findings, presented recommendations and began an improvement list for backlog planning.

Usability evaluation and design recommendations

Home - Navigation

-  Purchase Tokens

-  Oak Achievements (coming soon!)
-  User Account
-  Log Out

A concrete mismatch starts the investigation

DOCUMENTED IN THE ORIGINAL EVALUATION

“User Account” opened a page headed “User Pages.”

The label and destination could leave a person unsure whether they reached the right place.

I compared labels and sitemap alternatives, then used documentation and walkthroughs to clarify work tickets.

Error feedback beside the field

I made the problem field visible where a person could act on it.

The recommendation gave the team a specific behavior to discuss and prioritize.

Original

The original login form is titled "Ready, Set..." with the subtitle "Log in to access your account". It features two input fields: "Email Address" and "Password". Below the fields are two buttons: "Log In" and "Send Me A One-Time Login Link". The form is set against a light blue background.

Original error at the page footer

Error: Invalid login credentials

Proposed

The proposed login form is identical to the original, but with a red border around the "Password" field and a green feedback message "Incorrect Password" displayed to the right of the field. The buttons and background remain the same.

Proposed feedback beside the field

Waiting is part of the conversation

I kept the question visible and gave the response a distinct waiting state.

Animation was an implementation question to resolve with engineering.

Original state detail

Recovery follows the failure

An incomplete answer and a lost connection need different next actions.

I assembled the flows and their next actions into an annotated handoff for engineering.

Incomplete answer

Connection lost

An answer needs a path back to evidence

01 Search the historical evidence

Bounded search returns source labels and stable evidence IDs.

`oppia_research → search_oppia_research`

02 Retrieve the exact evidence

Fetch the selected chunk before quoting; keep its source reference.

`get_oppia_evidence`

I built a read-only tool that helps an AI assistant find historical research, keep source references and identify evidence gaps.

Retrieval stays bounded and traceable

SQLite full-text search ranks matches with BM25. Results keep stable record and evidence IDs.

repository.py

```
66 self.connection = sqlite3.connect(  
67     f"file:{resolved}?mode=ro", uri=True, check_same_thread=False  
68 )  
69 self.connection.row_factory = sqlite3.Row  
70 self.connection.execute("PRAGMA query_only = ON")
```

The assistant can fetch exact evidence before quoting it. Evidence gaps remain visible.

Explaining technical work to the people using it

As an IT Specialist, I supported campus system updates and the transition to hybrid work.

Later AI analysis and instructional-design work involved translating learner needs into prototypes, findings and accessible materials.

A status record answers the next question

What needs attention?

Capture the reported problem, affected scope and supporting evidence under the team's access rules.

Who owns the next step?

Keep the owner, action and next update time visible to the people waiting on the work.

What is confirmed?

Check impact and open questions with the technical specialist responsible for the issue.

What closes the loop?

Confirm resolution, record what changed and flag recurring problems for review.

Let's make issue follow-through easier

Mesa, Arizona. Full U.S. work authorization. Available to start as soon as possible and travel 10–20%.
